Wayne Chang 張耿維

AI Adoption & Digital Transformation Project Manager

Email **aris.wei@gmail.com**
Portfolio **waynechang-pm.github.io**

Bringing AI into knowledge-work workflows such as research, finance, documents, and operations, and finding workable solutions where regulation, finance, and competing interests meet.

Project management and consulting experience across public-infrastructure financial advisory, a smart-parking technology company, and a national cultural-heritage digitization project, including serving as project manager on 13 public-infrastructure and asset-development projects. Skilled in requirements analysis, financial evaluation, and cross-organization coordination, shaping executable plans within regulatory, cost, and stakeholder constraints.

Able to turn complex analysis and business rules into tools that frontline staff can operate: designed an automated rent calculator for agency case officers and took part in planning the rollout of AI license-plate recognition for parking ticketing. In recent years I have combined multiple generative AI tools to turn research, financial checks, documents, and presentation-video production into repeatable workflows, and I hope to go further into enterprise AI adoption and process improvement.

My Story

I come from a humanities background. My training and work experience taught me to understand the problem first, then clarify requirements, break down the process, coordinate different specialists, and hold the line on delivery quality.

When I started using AI, I applied the same project-management method to AI collaboration: define the goal and the input data, assign roles to the tools, set checkpoints, and confirm myself that the result meets the need. Software development is not my original specialty, so I put more weight on stating requirements and judgment criteria clearly, and on confirming results through testing and review.

This résumé site and its story film are work I completed with this method. They also show how I break an idea down into a process and carry it through to a concrete result.

~8 years	30+	13	7 of 11	3
of project management experience	public infrastructure, asset development, and digital projects	projects as project manager	government tenders led and won	new clients or inbound invitations earned through delivery

Experience

Financial Advisory Firm | Deputy Manager, Project Department / Project Manager

Nov 2022 – Present

- Project manager on 13 public-infrastructure and asset-development projects covering feasibility studies, financial models, investment solicitation, priority contract renewals, and contract management, for clients including central government bodies, a defense medical institution, a national cultural institution, and local governments.
- Led 11 government tender bids and won 7; responsible for bid strategy, issue analysis, proposals, and selection-panel presentations.
- Carried out market research and analysis using in-depth interviews, market data collection, and surveys to assess supply and demand, fair pricing, and operating direction, across markets including fiber-optic cable conduits, public land development, transit-hub retail, exhibition venues, and ecological parks; also designed service-satisfaction surveys with importance–performance analysis, IPA, to evaluate service quality.
- Led a valuation and lease-pricing study of fiber-optic cable assets for a central government body: a team of four over about six months interviewed 12 organizations, built a hedonic price regression model from 95 market rent data points, and used an AHP survey of 15 experts to set the base rate and discount tiers; all three stage reports passed review.
- Delivery led to follow-on business: the firm became a service provider to a major telecom operator, a public agency invited further quotations, and a financial institution made an inbound inquiry.
- Brought AI into knowledge-work workflows in research, finance, and documents: used Claude and other tools for regulatory research, contract clause checks, financial-model verification, meeting minutes, official correspondence, and report writing, with results reviewed by me.
- Beyond the contract scope, proactively designed an automated rent calculator for agency case officers: prices used to differ by route section and fiber count and had to be worked out section by section; with the contract terms built in, selecting the conditions now gives the correct rent.

Smart Parking Technology Company | Project Planner

Aug 2020 – Oct 2021

- At a parking-technology company built on AI vision recognition and smart guidance, served as the link between requirements, R&D, and operations, planning how AI features developed by R&D would be deployed in real parking facilities and on-street parking.
- Took part in planning the rollout of AI license-plate recognition for on-street parking ticketing: ticketing staff used to key in plate numbers by hand, and input errors led to penalties and company losses. After studying their ticketing motions, working habits, and the limits of the device screen, planned the introduction of an AI plate-recognition system that runs directly on the device. Within six months of real use, it helped cut the ticketing error rate from 3% to 0.2%.
- Took part in bidding and planning for 7 local-government parking concession projects, covering financial projections, AI equipment deployment plans, proposals, and presentations.
- Conducted site surveys and requirement interviews to understand parking supply, demand, and user needs as the basis for equipment and budget planning; researched new technologies and potential partners in adjacent industries to support new business.
- Coordinated R&D, operations, and external technology partners and chaired cross-department meetings to move projects from planning to execution.

Cultural Heritage Archive Management Company | Project Team Lead

Aug 2019 – Jul 2020

- Led the team building a national cultural-heritage database, a culture digitization project in the NT$10-million range, covering planning, workflow, staffing, and quality control through final acceptance.
- Researched adjacent industries and potential partners, combining fieldwork and literature review, and proposed the department's core development direction.
- Established the department's cross-project management method and took part in public-sector tenders.

AI Adoption Cases

A Automated rent calculator

Users: agency case officers | Valuation and lease pricing of fiber-optic cable assets for a central government body

Problem	The agency managed the leasing of its fiber-optic cable assets with a separate price for every route section and fiber count, so case officers had to work out the rent section by section, which was slow and error-prone.
Assessment	Combined market rent analysis to set a base price and discount rules, then turned the pricing model into an automated rent calculator. Once a case officer selects the route, start and end points, fiber count, and lease term, the matching data is filled in and the annual rent is calculated, cutting section-by-section price lookups and manual calculation. A user manual keeps the pricing rules and procedures consistent and lowers the risk of human error.
Action	Beyond the contract scope, used AI to help build an automated Excel calculator and personally checked the formulas and results.
Results	The Excel tool and user manual were handed over to the agency's case officers and were well received: the agency invited quotations for further studies, and the work helped the firm become a service provider to a major telecom operator.

B AI license-plate recognition for ticketing

Users: frontline ticketing staff | Smart-parking technology company

Problem	On-street parking ticketing staff keyed in plate numbers by hand; input errors were common and led to penalties and company losses.
Assessment	Studied ticketing motions, working habits, and device-screen limits on site to find an approach that fits field work.
Action	Planned the introduction of an AI plate-recognition system that runs directly on the device, coordinated the needs of R&D, operations, and frontline staff, and pushed it to launch.
Results	Within six months of real use, the ticketing error rate fell from 3% to 0.2%.

C AI-assisted production workflow for presentation videos

Self-led applied practice | Selection-panel presentation for a local-government BOT contract-management project

Problem	Proposals and selection-panel presentations are dense, and the service highlights and team strengths must come across in limited time, so I planned a short closing film that condenses the proposal and echoes its core message.
Assessment	Designed an AI workflow package: put in the proposal content and key points, and it automatically produces an introduction video that reinforces how the project will be carried out.
Action	Packaged prompts, review checklists, and editing code into a reusable workflow. Claude handles the script, storyboard, prompts, and content checks and directs the other AI tools via API; OpenAI Codex and Google Gemini generate frames and motion; Claude writes the Python and ffmpeg code for editing. Each step is checked before the next. I set the goals, prepare the inputs, assign the tools, and review the results.
Deliverables	A toolkit that takes the proposal and evaluation criteria, asks follow-up questions, and produces a 2 min 46 s, 1080p proposal video of real photos, information cards, and AI-generated illustrative shots, validating the path from proposal documents to video.

D Interactive résumé site

Personal applied practice, proof of concept for multi-AI operation

Problem	A traditional résumé can only describe in words; it is hard to show the ability to actually apply AI.
Assessment	Conceived, planned, and designed a résumé site that combines a story film with interactive tags.
Action	Directed multiple AI tools in defined roles to complete data de-identification, the story film in Chinese and English, the site, and the PDF résumé, with review and checks at every stage.
Results	The site is live at waynechang-pm.github.io, with a 1 min 10 s story film, a Chinese/English switch, and the full résumé as PDF.

AI in Practice

Timeline	Worked with image-recognition and smart-service AI from 2020, deploying it in real settings; used ChatGPT for market and regulatory research from 2024; since 2025, large language models have been built into my workflow and used daily, now with Claude at the core, directing other AI tools to deliver complete end-to-end workflows, plus purpose-built toolkits for specific tasks.
Research & market analysis	Use AI to set up a starting point for analysis quickly, such as estimating the catchment population needed to support a facility, the market size of a specific recreation site, visitor numbers and occupancy rates, venue utilization, and fit-out unit costs. I ask AI for the basis of its figures and then verify the sources.
Regulatory research	Find and compare legal bases and procedures, such as environmental impact assessment screening, historic-building designation and cultural-heritage checks, permitted uses under land-use zoning, how PPP and procurement rules apply together, and how superficies rights in industrial parks differ from ordinary ones, with results reviewed by me.
Finance	Use AI to check financial models and analyze operating performance and financial statements; designed Excel lookup-and-sum logic that later grew into the automated rent calculator.
Documents	Turn meeting transcripts into minutes, sort review comments by committee member, and draft item-by-item replies; extract from draft contracts the materials and actions due on a regular and ad hoc basis; check reports for consistent terminology and connected concepts, among other document tasks.
Operations	Turn business rules into tools frontline staff can operate; see case A, the automated rent calculator, and case B, AI plate recognition for ticketing.
Multi-AI collaboration	Claude, OpenAI Codex, and Google Gemini working in defined roles to produce video and websites; see cases C and D.
Personal experiment	Designed a full rule set so that AI completes a daily information analysis within a fixed framework, logs its errors, and revises the rules, to test how reliably AI can exercise judgment under explicit rules.

Track Record

Other representative projects | as project manager

Type	Project	My role and results
Defense medical institution	Pre-tender PPP planning for a hospital retail arcade and ancillary facilities, 2 projects	Project manager, from bid and award to close-out
National cultural institution	ROT pre-tender planning for dining and public service spaces	Project manager, from bid and award to close-out
Transit hub	BOT contract management for a station building in its operating phase, 2 consecutive terms	Project manager; led from the bid stage in the second term
Special municipality	Financial evaluation and contract advisory for an ecological theme park and parking BOT/OT	Issue and market analysis at bid stage, later took over as project manager; financial and legal analysis supported the agency's final decision
Local government	ROT contract management for a group of historic buildings	Project manager, from bid and award to close-out
Local government	BOT contract management for public markets, 2 projects	Project manager; handled an IP-licensing dispute, a change of partner vendor, and the design of a service-satisfaction survey. Highlight: designed an AI workflow package for presentation videos; see AI adoption case C
Local government	BOT pre-tender planning and investment solicitation for a memorial park	Project manager, from bid to execution
Local government	OT priority contract renewal for a park and parking facility	Project manager; financial analysis and basic requirements document completed
Local government	OT financial evaluation and investment solicitation for an arts park	Project manager

Also contributed to: market analysis for public land development, financial analysis for a cold-chain logistics center, and bid-stage issue analysis for several station, exhibition venue, market, and parking projects.

Skills & Tools

Project management	Project planning and execution, detailed cost breakdown, meeting design, cross-department coordination, bid strategy
Finance & regulation	Financial modeling, market research, feasibility studies, Taiwan's PPP Act, Government Procurement Act, contract management
Research methods	Survey design, statistical analysis with Stata, qualitative interviews, fieldwork
Documents & design	Word, Excel, PowerPoint, InDesign

AI tools

Chat & collaboration	Claude at the core, with Projects and memory; Claude Cowork, ChatGPT
AI agents	Claude Code, directing AI to read and write files, run programs, and operate a browser; OpenAI Codex
Skills platform	Claude Skills with Plugins and MCP connectors, to standardize repeatable workflows
Generative media	Google Gemini video generation, OpenAI image generation
AI-assisted development	Python, ffmpeg video post-production, Node.js automated Word reports, and HTML pages, written by AI and directed and accepted by me

Education & Languages

Education	National Taiwan University, B.A., double major in Sociology and History, 2018
Languages	Mandarin Chinese native, English intermediate, Japanese basic
