AI Adoption Project Manager

Email **aris.wei@gmail.com**

AI Adoption Project Manager: finding workable solutions where regulation, finance, and competing interests meet.

Nearly 8 years of project management experience across public-infrastructure financial advisory, a smart-parking technology company, and a national cultural-heritage digitization project. Project manager on 13 public-infrastructure and asset-development projects, for clients including central government bodies, a defense medical institution, a national cultural institution, and local governments.

I specialize in finding executable options within regulatory limits, financial feasibility, and competing interests, and in turning complex analysis into tools that others can pick up and use. Today I work with Claude at the core, directing multiple AI tools for research, documents, data analysis, and video production. My goal is to bring AI into real workplaces and make it actually land.

~8 years
of project management experience

30+
public infrastructure, asset development, and digital projects

13
projects as project manager

7 of 11
government tenders led and won

3
new clients or inbound invitations earned through delivery

Experience

凌群策略財務顧問有限公司 (financial advisory firm, public infrastructure) | Deputy Manager, Project Department / Project Manager

Nov 2022 – Present

- Project manager on 13 public-infrastructure and asset-development projects covering feasibility studies, financial models, investment solicitation, priority contract renewals, and contract management, for clients including central government bodies, a defense medical institution, a national cultural institution, and local governments.
- Led 11 government tender bids and won 7; responsible for bid strategy, issue analysis, proposals, and selection-panel presentations.
- Carried out market research and analysis using in-depth interviews, market data collection, and surveys to assess supply and demand, fair pricing, and operating direction, across markets including fiber-optic cable conduits, public land development, transit-hub retail, exhibition venues, and ecological parks; also designed service-satisfaction surveys (including importance–performance analysis, IPA) to evaluate service quality.
- Delivery led to follow-on business: the firm became a service provider to a major telecom operator, a public agency invited further quotations, and a financial institution made an inbound inquiry.
- Used Claude and other AI tools for regulatory research, financial-model checks, meeting minutes, official correspondence, and report writing; proactively developed an automated rent calculator as a value-added service beyond the contract.

歐特儀股份有限公司 (smart-parking technology company) | Project Planner

Aug 2020 – Oct 2021

- At a parking-technology company built on AI vision recognition and smart guidance, planned how AI features developed by R&D would be deployed in real parking facilities and on-street parking.
- Took part in bidding and planning for 7 local-government parking concession projects, covering financial projections, AI equipment deployment plans, proposals, and presentations.
- Conducted site surveys and requirement interviews to understand parking supply, demand, and user needs as the basis for equipment and budget planning; researched new technologies and potential partners in adjacent industries to support new business.
- Coordinated R&D, operations, and external technology partners and chaired cross-department meetings to move projects from planning to execution.

博士門股份有限公司 | Project Team Lead

Aug 2019 – Jul 2020

- Led the team building a national cultural-heritage database, a culture digitization project in the NT$10-million range, covering planning, workflow, staffing, and quality control through final acceptance.
- Researched adjacent industries and potential partners, combining fieldwork and literature review, and proposed the department's core development direction.
- Established the department's cross-project management method and took part in public-sector tenders.

Key case | Valuation and lease pricing of fiber-optic cable assets for a central government body

- Project manager for a central-government fiber-optic asset valuation project. With a team of four, completed a three-stage report (demand study, asset valuation, leasing options) in about six months, interviewing 12 organizations including telecom operators, public conduit owners, and experts. All reports passed review.
- Built a hedonic price regression model from 95 market rent data points, combined with an AHP survey of 15 experts, to set a base rate, length and term discount tiers, and regional price differences, and completed the lease contract and operating procedures.
- Proactively used AI to help develop an automated rent calculation model and user manual (a value-added service beyond the contract). Staff select the route, start and end points, fiber count, and lease term to get the annual rent; other key information is filled in automatically rather than typed by hand, reducing human error.
- Follow-on impact: the agency invited quotations for further studies, and the firm became a service provider to a major telecom operator.

AI in Practice

Timeline	Worked with image-recognition and smart-service AI from 2020, deploying it in real settings; since 2025, large language models (LLMs) have been built into my workflow and used daily.
At work	Claude for regulatory research, contract clause checks, financial-model verification, turning meeting recordings into minutes, and drafting official correspondence and reports; reports are produced as Word files by AI with automatic formatting.
Tools built	An automated rent calculation model (see the key case under Experience).
Multi-AI collaboration	Claude, OpenAI Codex, and Google Gemini working in defined roles to produce video (see the key case below).
Personal experiment	Designed a full rule set so that AI completes a daily information analysis within a fixed framework, logs its errors, and revises the rules, to test how reliably AI can exercise judgment under explicit rules.
Early experience	In 2020 at a smart-parking technology company, planned the deployment of AI vision features in real settings.

Key case | A video production workflow with Claude directing multiple AIs

- With no programming background, built a multi-AI video workflow centered on Claude: Claude handles the script, storyboard, prompts, and quality checks; OpenAI Codex draws the frames; Google Gemini generates motion; and AI-written Python/ffmpeg code does the editing and post-production.
- From a proposal document and key points, AI completes the script, storyboard, and edit, producing a 2 min 46 s, 1080p presentation video that combines real-photo motion, information cards, and AI-generated illustrative shots. Content was reviewed by AI and checked item by item by me; facts and figures are correct.
- Designed a gate process — review the text first, then the images, and only then generate video — so errors are caught before money is spent. AI video generation cost was minimal, with no wasted tokens.

Track Record

Other representative projects (as project manager)

Type	Project	My role and results
Defense medical institution	Pre-tender PPP planning for a hospital retail arcade and ancillary facilities (2 projects)	Project manager, from bid and award to close-out
National cultural institution	ROT pre-tender planning for dining and public service spaces	Project manager, from bid and award to close-out
Transit hub	BOT contract management for a station building, operating phase (2 consecutive terms)	Project manager; led from the bid stage in the second term

Type	Project	My role and results
Special municipality	Financial evaluation and contract advisory for an ecological theme park and parking BOT/OT	Issue and market analysis at bid stage, later took over as project manager; financial and legal analysis supported the agency's final decision
Local government	ROT contract management for a group of historic buildings	Project manager, from bid and award to close-out
Local government	BOT contract management for public markets (2 projects)	Project manager; handled an IP-licensing dispute, a change of partner vendor, and the design of a service-satisfaction survey
Local government	BOT pre-tender planning and investment solicitation for a memorial park	Project manager, from bid to execution
Local government	OT priority contract renewal for a park and parking facility	Project manager; financial analysis and basic requirements document completed
Local government	OT financial evaluation and investment solicitation for an arts park	Project manager

Also contributed to: market analysis for public land development, financial analysis for a cold-chain logistics center, and bid-stage issue analysis for several station, exhibition venue, market, and parking projects.

Skills & Tools

Project management	Project planning and execution, detailed cost breakdown, meeting design, cross-department coordination, bid strategy
Finance & regulation	Financial modeling, market research, feasibility studies, Taiwan's PPP Act (Act for Promotion of Private Participation in Infrastructure Projects), Government Procurement Act, contract management
Research methods	Survey design and statistical analysis (Stata), qualitative interviews, fieldwork
Documents & design	Word, Excel, PowerPoint, InDesign

AI tools (all hands-on)

Chat & collaboration	Claude (core; Projects and memory), Claude Cowork, ChatGPT
AI agents	Claude Code (directing AI to read and write files, run programs, and operate a browser), OpenAI Codex
Skills platform	Claude Skills with Plugins / MCP connectors, to standardize repeatable workflows
Generative media	Google Gemini (video generation), OpenAI image generation
AI-assisted development	Python, ffmpeg (video post-production), Node.js (automated Word reports), and HTML pages — written by AI, directed and accepted by me

Education & Languages

Education	National Taiwan University — B.A., double major in Sociology and History (2018)
Languages	Mandarin Chinese (native), English (intermediate), Japanese (basic)
